IAEA Network of Centers of Excellence

WIPP Site Selection and Characterization Studies

Carlsbad Field Office,
U.S. Department of
Energy – Sep. 2004
(with assistance from Sandia
National Laboratories)

Early WIPP Site Studies

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence

National Academy of Sciences (NAS) concludes that the most promising disposal option for radioactive wastes is in salt deposits.

"Salt at great depth 'flows.' It will encapsulate any waste placed at depth and isolate it from the surface environment for eons."

"The great advantage is that no water can pass through salt. Fractures are self healing."

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence

Bedded Salt, Chosen Purposefully, for the Siting of the US Defense Nuclear Wastes

- Salt can be mined easily
- Salt is known to flow slowly under the pressure of overlying beds, and therefore will consolidate around the waste and isolate it in place
- Salt is essentially impermeable
- Fractures in salt are self healing
- Salt that has existed underground for millions of years will almost certainly remain stable for millions of years into the future
- Salt has a relatively high thermal conductivity
- Wide geographic distribution (many potential sites)

Site Selection Criteria

established in 1960's by early investigators (ORNL)

- Geological Criterion** - The geology must protect the repository from breaching by natural phenomena. The geology must also permit safe operation of the repository
- Hydrology Criterion** - The hydrology must provide high confidence that natural dissolution will not breach the site. Accidental penetrations (unintentional human intrusion) should not result in undue hazards to intruder or subsequent generations.
- Tectonic Stability Criterion** - Natural tectonic processes must not result in a breach of the site and should not require extreme precautions during the operational period of the repository.
- Physical-Chemical Compatibility** - The repository medium must not interact with the waste in ways which create unacceptable operational or long-term hazards.
- Economic/Social Compatibility Criterion** - The site must be operable at reasonable economic cost and should not create unacceptable impact on natural resources or the biological/sociological environment.

* while the waste poses a significant hazard to man

4

Initial candidate sites are soon focused on bedded salt deposits in relatively remote areas

1968-1971 experiments at existing salt mines near Lyons Kansas

Local politicians from Carlsbad, NM learn of problems at Lyons (1972), and actively pursue AEC to explore nearby potash district for candidate sites

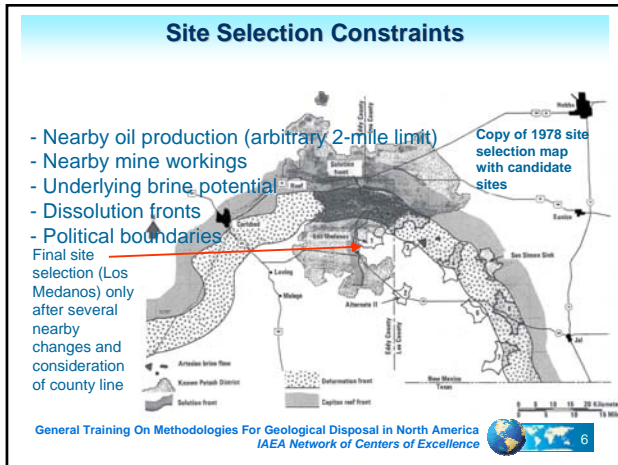

Nearby oil production (holes through a shallow and thin salt section) provided easy targets for critics and the Lyons site became politically troubled very quickly

Delaware Basin turns out to be deepest and thickest, but nearby oil production and potash mining still make site selection controversial

5

Congress passes the DOE National Security and Military Applications of Nuclear Energy Authorization Act of 1980.

Act authorized DOE to construct WIPP and to seek New Mexico endorsement to operate a geologic repository for waste generated for defense purposes (weapons development waste). Firmly separated weapons production waste disposal from power production waste disposal in the US.

December 29, 1979

Substantial influence by both local and state politicians to proceed. Economic impact (jobs) drove influence but "good science" demanded at every step!

Senator
Pete
Domenici

Major WIPP events (1 of 3)

- 1957 NAS recommends geologic disposal especially in salt
- 1968-1972 Experiments in salt at Lyons, Kansas salt mine
- 1972 Lyons site rejected (both politically and technically)
- 1972 By August, ORNL begins Carlsbad studies
- 1975 Initial WIPP site selected (several nearby changes made as site specific characterization proceeds)
- 1979 Public Law 96-164 authorizes WIPP for Defense TRU waste
 - separates weapons waste disposal from power production
- 1980 FEIS Published
- 1981 Site and design validation work begins
- 1983 Site validation, full-facility construction starts
- 1985 EPA issues 40 CFR 191
- 1987 DOE applies RCRA rules to WIPP
- 1988 WIPP technically ready – but politics steps in.....

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence  15

Major politically motivated WIPP events after 1988 facility readiness (2 of 3)

- 1989 No migration variance petition filed with EPA
- 1990 EPA grants conditional NMVP
- 1991 DOE again grants WIPP readiness
- 1991 DOE obtains WIPP Site Administrative Land Withdrawal
- 1991 State of New Mexico files for preliminary injunction
- 1992 Injunction issued, later PARTIALLY overturned
- 1992 WIPP Land Withdrawal Act passed; transfers land from DOI to DOE; established EPA as regulator
- 1993 In situ test plans with radioactive waste at WIPP site issued and then abandoned (tests to be performed at a national laboratory)
- 1995 DOE submits draft compliance application to EPA; draft RCRA permit to NMED
- 1996 Amendment to WIPP Land Withdrawal Act removes WIPP land disposal restrictions from RCRA

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence  16

The steps to final regulatory approval - major WIPP events (3 of 3)

- 1997 WIPP Disposal Phase Final Supplemental EIS issued
- 1998 EPA certifies that WIPP complies with 40CFR191
- 1998 NMED issues drafts of RCRA Part B Permit
- 1998 DOE announces intent to dispose of non-mixed waste
- 1998 New Mexico AG and others file suit over EPA certification
- 1998 NMED protests but later confirms initial LANL waste is non-mixed
- 1999 1992 injunction voided by Judge Penn
- 1999 WIPP receives first non-mixed waste from LANL on March 26
- 1999 WIPP receives INEEL non-mixed waste on April 28

Keys to Successful Siting & Licensing of WIPP (1 of 6)

- National need: Clean up the US nuclear weapons production complex
- Existence of federal legislation authorizing and enabling WIPP to exist
- Existence of regulatory standards and rules for licensing of WIPP
- Solid site selection criteria, heavily influenced in their formulation by the WIPP Project itself
- Independent and technically competent federal regulator (EPA)

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence  18

Keys to Successful Siting & Licensing of WIPP (2 of 6)

- Existence of a clear *quid pro quo* for citizens of the state and local jurisdiction in which the repository is sited
- Solid local support (and local support with "clout")
- Competent technical oversight by the State of New Mexico (via EEG)
- Phased approach: feasibility, viability, licensing
- Collegial interactions among all involved, including regulators and oversight groups, especially in the early phases

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence  19

Keys to Successful Siting & Licensing of WIPP (3 of 6)

- Single scientific decision-making authority (Sandia National Laboratories)
 - In-state
 - Independent
 - High integrity
 - Technical excellence
 - Solid reputation
 - Reputation enhanced through involvement in WIPP
- Intense and early public outreach
- Invocation of peer review
 - First by the national laboratory
 - Eventually at the behest of the federal regulator

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence  20

Keys to Successful Siting & Licensing of WIPP (4 of 6)

- Rigorous quality assurance from the early stages of the project:

Principles (T²R³)

Traceability
Transparency
[Independent] Review
Reproducibility
Retrievability

Applied to

Data
Models
Parameters
Software

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence

Keys to Successful Siting & Licensing of WIPP (5 of 6)

- Rigorous quality assurance (continued):

Using tools such as

Test plans
Analysis plans
Analysis packages, and
Configuration management for everything, including and
especially calculations

- Focused collection of scientific data, relying on
Development of preliminary conceptual models
Use of Features, Events, and Processes (FEPs) and scenarios

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence

Keys to Successful Siting & Licensing of WIPP (6 of 6)

- Science focused on compliance: knowing when enough is enough
Basic understanding of physical processes at work in and
around the repository, coupled with
Conservative bounding cases, and
Having a quantitative target at which to shoot
- Persistence

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence

Things to Avoid, If Possible

- The necessity to qualify existing scientific data
- Imbalance among regulatory entities relative to the risk to public health and safety each seeks to regulate (hazardous [chemical] waste versus radioactive waste)
- Do not ignore the emotional methods of the anti-nuclear activists.

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence  24

Technical and Regulatory Lessons Learned at WIPP

- One is most confident of the site and repository issues at the beginning of detailed investigation
- Site studies will inevitably find “issues” the critics will utilize to pursue their case
- Do not oversell or over-simplify the attributes of the site until they are confirmed
- The site and repository design must be robust enough to weather uncertainties in models or natural variation in physical parameters as detailed knowledge of site and relevant processes unfold
- Independent expert review is essential to scientific credibility
- Quality assurance must be applied reasonably and thoroughly on all project activities important to licensing
- Data / information management is critical in regulatory review

General Training On Methodologies For Geological Disposal in North America
IAEA Network of Centers of Excellence  25

Philosophical Lessons Learned at WIPP

- Credibility is paramount, both its establishment and its maintenance
Remember, an uninformed majority must be able to decide between a (credible) project position and the less than complimentary picture portrayed by critics
- Repository science must be focused on compliance
- There must be something credible to comply with
Setting repository performance criteria before siting studies begin provides a target to aim for
- Persistence pays
